DETAIL SPECIFICATION

EXPANSION JOINTS, PIPE, METALLIC BELLOWS, GENERAL SPECIFICATION FOR

This specification is approved for use by all Departments and Agencies of the Department of Defense.

1. SCOPE

1.1 Scope. This specification covers metallic bellows expansion joints used to absorb dimensional movement in piping systems. This movement may be caused by thermal expansion, contraction, or adjacent structural movements.

1.2 Classification. The expansion joints are of the following types and classes as specified (see 6.2).

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type I</td>
<td>Corrugated bellows, unreinforced.</td>
</tr>
<tr>
<td>Type II</td>
<td>Corrugated bellows, reinforced.</td>
</tr>
<tr>
<td>Type III</td>
<td>Fabricated bellows.</td>
</tr>
<tr>
<td>Class 1</td>
<td>Single bellows expansion joint.</td>
</tr>
<tr>
<td>Class 2</td>
<td>Double bellows expansion joint.</td>
</tr>
<tr>
<td>Class 3</td>
<td>Pressure balanced expansion joint.</td>
</tr>
<tr>
<td>Class 4</td>
<td>Externally pressurized single or double expansion joint.</td>
</tr>
<tr>
<td>Class 5</td>
<td>Universal expansion joint</td>
</tr>
<tr>
<td>Class 6</td>
<td>Hinged expansion joint</td>
</tr>
<tr>
<td>Class 7</td>
<td>Gimbal expansion joint</td>
</tr>
</tbody>
</table>

Note: Not every class applies to every type of expansion joint.

Comments, suggestions, or questions on this document should be addressed to: Defense Supply Center, Columbus, Attn: DSCC-VAI, P.O. Box 3990, Columbus OH 43218-3990, or emailed to FluidFlow@dla.mil. Since contact information can change, you may want to verify the currency of this address information using the ASSIST Online database at http://assist.daps.dla.mil.
1.3 Part or Identifying Number (PIN). The PIN to be used for metallic bellows, expansion joint pipes acquired to this specification are created as follows:

<table>
<thead>
<tr>
<th>M</th>
<th>17813</th>
<th>/1 - 3 - 1 - 150 - W</th>

- **Size**
- **Specification sheet number**
- **Specification number**
- **M prefix**

2. APPLICABLE DOCUMENTS

2.1 **General.** The documents listed in this section are specified in sections 3, 4, or 5 of this specification. This section does not include documents cited in other sections of this specification or recommended for additional information or as examples. While every effort had been made to ensure the completeness of the list, document users are cautioned that they must meet all specified requirements documents cited in sections 3, 4, or 5 of this specification, whether or not they are listed.

2.2 **Government documents.**

2.2.1 **Specifications, standards, and handbooks.** The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those listed in the solicitation or contract.

**DEPARTMENT OF DEFENSE SPECIFICATIONS**

(See supplement 1 for list of specification sheets.)

2.3 **Non-Government publications.** The following documents form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are cited in the solicitation or contract.

**AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)**

- ASME B16.5 - Steel Pipe Flanges and Flanged Fittings
- ASME B31.1 - Piping, Power
- ASME - ASME Boiler and Pressure Vessel Code

2.4 Order of precedence. Unless otherwise noted here in or in the contract, in the event of a conflict between the text of this document and the references cited herein (except for related specification sheets), the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.
3. REQUIREMENTS

3.1 Specification sheets. The individual item requirements shall be as specified herein and in accordance with the applicable specification sheet. In the event of any conflict between the requirements of this specification and the specification sheet, the latter shall govern.

3.2 Standard commercial product. The expansion joint shall, as a minimum, be in accordance with the requirements of this specification and shall be the manufacturer’s standard commercial product. Additional or better features which are not specifically prohibited by this specification but which are a part of the manufacturer’s standard commercial product, shall be included in the expansion joint being furnished. A standard commercial product is a product, which has been sold or is being currently offered for sale on the commercial market through advertisements, manufacturer’s catalogs, or brochures, and represents the latest production model.

3.3 First article. When specified (see 6.2), a sample shall be subjected to first article inspection in accordance with 4.5.

3.3.1 Determination of movement. In determining the qualifying rated contraction or extension, consideration shall be given to the equivalent axial movement due to lateral deflection and angular rotation. Equivalent axial movement shall be added to the actual specified values of axial movement and shall be computed in accordance with the EJMA Standards.

3.3.2 Universal, swing, and pressure-balanced expansion joints. Universal, swing, and pressure-balanced expansion joints consist of two or more bellows connected by pipe sections or fittings. Since it is not the intent of the specification to test these units as assemblies, only one prototype bellows is required to approve any such combination of bellows.

3.4 Materials. Materials used shall be free from defects, which would adversely affect the performance or maintainability of individual components, or of the overall assembly. Materials not specified herein shall be of the same quality used for the intended purpose in commercial practice. Unless otherwise specified herein, all equipment, material, and articles incorporated in the work covered by this specification are to be new and fabricated using materials produced from recovered materials.

3.4.1 Recycled, recovered, or environmentally preferable materials. Recycled, recovered, or environmentally preferable materials should be used to the maximum extent possible, provided that the material meets or exceeds the operational and maintenance requirements, and promotes economically advantageous life cycle costs.

3.4.2 Pipe and bellows materials. Material for the bellows shall be one or more of the following:

a. ASTM A240/A240M - Types 304, 304L, 310, 316, 316L, 321, 347, or 348.
b. ASTM B36/B36M - 70/30 Brass (UNS C26000).
c. ASTM B103/B103M - Grade A Phosphor Bronze (UNS C51100).
d. ASTM B127 - Class A Nickel Copper Alloy.
e. ASTM B152/B152M - UNS C11000, C11300, C11400, C11600, C12000, C12200, C12300, C12500, or C14200.
f. ASTM B162 - Nickel.
g. ASTM B168 - Nickel-Chromium-Iron Alloy.
h. ASTM B194 - Beryllium Copper.
i. ASTM B265 - Titanium and Titanium Alloy.
Material not definitely specified shall be of the quality used for the purpose in commercial practice (see 6.2).

3.5 Performance.

3.5.1 Movement. The expansion joint shall be capable of absorbing the normal operating movement, such as axial, lateral, angular, or a combination of these movements as specified (see 6.2 and 6.3).

3.5.1.1 Additional movement. When specified (see 6.2), the expansion joint shall be physically capable of absorbing an additional movement in an amount up to the rated movement of the joint (see 6.3). This movement can be installation tolerances or upset conditions; the nature of this movement must be specified (see 6.2).

3.5.1.2 Cyclic endurance (see 4.8.2). The capacity of the expansion joint to withstand the number of cycles specified shall be determined in accordance with the EJMA Standards, a history of successful operation of similar bellows, or by a qualification test, and shall be specified (see 6.2). The manufacturer shall certify compliance with these requirements.

3.5.2 Deflection force (see 4.8.4). The force required to deflect the expansion joint shall be equal to or less than the force specified (see 6.2). The connecting piping shall be properly guided and anchored in accordance with the EJMA Standards.

3.5.3 Expansion joint stability. The expansion joint shall be designed as to preclude instability when the joint is tested in accordance EJMA Standards. Instability shall be as specified in the EJMA Standards.

3.5.4 Hydrostatic. When tested as specified in 4.8.1, the expansion joint shall be free of leaks, resistant to plastic deformation, and found to be stable as specified in EJMA Standards.

3.6 Construction. The expansion joints covered by this specification shall be designed and constructed in accordance with the generally accepted engineering principles set in ASME B31.1, or section VIII, division 1, of the ASME Boiler and Pressure Vessel Code, and/or the EJMA Standards.

3.6.1 End connections. The connecting ends of the joints shall be provided with pipe flanges or welded nipples as specified (see 6.2). Flange dimensions shall conform to the diameter and drilling of ASME B16.5. The size, material, and pressure class shall be as specified (see 6.2). Facing shall be as specified. Unless otherwise specified (see 6.2), the manufacturer may furnish “Van Stone” facings, made by turning or flaring the ends of the bellows over the flange face. The outside diameter of the Van Stone facing is to be the same as an equivalent lap stub end, or the raised face of the mating flange if different. The face of the Van Stone, however is not a machine finish and it may not comply in every respect with the ASME B16.5 dimensions for a raised face. A lap joint stub end may be provided when necessary. Welding nipples shall be of a size, material, and nominal wall thickness designation specified, and shall be beveled for welding.

3.6.2 Limit stops. When required for proper operation (see 6.2), limit stops shall be provided and arranged to limit the movement of the joint to that for which it is designed.
3.6.3 **System alignment.** Piping adjacent to the expansion joint shall be properly aligned and guided so that the expansion joint is subjected to only those movements for which it is designed. On a universal expansion joint incorporating tie-rods, the rods may be used to support the weight of the center section. Joints aligned by internal guides shall have suitable means provided to prevent excessive annular pressure between the guide and the bellows. (Note: The use of internally or externally guided expansion joints does not eliminate the necessity of using adequate external pipe guides.)

3.6.4 **Guiding.** Expansion joints may have guides located both internally and externally or only internally to the chamber, as specified (see 6.2). Guides shall be integral with the body or rigidly attached to the tube. They shall be concentric with each other, with the body of the joint, and with the tube. Limit stops shall be furnished in accordance with the manufacturer’s standard practice.

3.6.5 **Flow liners.** Flow liners and material for these liners shall be specified for all expansion joints, regardless of the metal of the bellows, in the following cases (see 6.2):

a. When friction losses should be held to a minimum and smooth flow is desired.

b. When flow velocities exceed those specified in the EJMA Standards.

c. When there is a danger of pitting or erosion, as in lines carrying abrasive solid particles, heavy sleeves are required.

d. During high temperature service with an uninsulated bellows, when it is necessary to decrease the temperature of the bellows and enable the metal to retain its higher mechanical properties.

e. When copper alloy bellows are used for high pressure drip, or superheated steam, hot water, or condensate, or when there is any possibility of flashing.

When flow liners are used in “vertical up” sections, drain holes shall be provided to prevent fluid or condensate accumulation. Flow liners should not be used when high viscosity fluids, such as tars, are being transmitted, since these fluids could accumulate and cause premature expansion joint failure. When the fluid is such that purging will effectively prevent accumulation, flow liners may be used in conjunction with purging connections. Flow liners should not be considered as substitutes for internal guides.

3.6.6 **Shrouds.** When specified (see 6.2), shrouds shall be provided which shall protect from external damage, prevent foreign material from falling between the corrugations of the bellows, and permit insulation of the expansion joint.

3.7 **Bellows material.**

3.7.1 **Copper alloy bellows.** Copper alloy bellows shall have their longitudinal seams joined by either welding or brazing operations. The bellows (except for those fabricated of diaphragms welded or brazed at inner and outer perimeters) shall be supplied in a stress relieved or annealed condition and shall be pickled to remove the heat treating scale. The maximum working pressure rating shall not exceed 25 pounds per square inch gage (psig) for corrugated, unreinforced joints or 200 psig for corrugated, reinforced joints.

3.7.2 **Corrosion-resistant steel bellows.** Corrosion-resistant steel bellows shall have their longitudinal seams joined by welding. The bellows may be stress relieved or annealed at the discretion of the manufacturer. When some form of heat treating is employed, the bellows shall be pickled to remove the resultant scale. (If iron or carbon steel forming tools are used with corrosion-resistant steel bellows, the bellows shall be passivated after forming.)

3.7.3 **Other bellow materials.** If materials other than those mentioned previously are used, the bellows shall be constructed in accordance with the manufacturer’s standard practice.
3.8 **Drawings.** A dimensional sketch or drawing in sufficient detail to describe the equipment, which the contractor proposes to furnish, shall be submitted to the agency concerned with the bid proposal (see 6.2). Such a drawing or sketch shall be accompanied by a copy of the manufacturer’s specification and rating data providing sufficient detail to signify compliance with the requirements of this specification.

3.9 **Treatment and painting.** Unless otherwise specified (see 6.2), the expansion joint shall be treated and painted in accordance with the manufacturer’s standard practice. All surfaces of the expansion joint other than corrosion-resisting steel shall be protected against corrosion and present a neat appearance.

3.10 **Marking.** Expansion joints shall be marked with the following: complete PIN, working pressure, maximum deflection, and working temperature range.

3.11 **Workmanship.** Workmanship shall be in accordance with the best commercial practice for this type of product. All expansion joints shall be clean and free of burrs, cracks, pits, porosity, and other imperfections affecting serviceability of this product.

4. **VERIFICATION**

4.1 **Classification of inspection.** The inspection requirements specified herein are classified as follows:

   a. First article inspection (see 4.5).

   b. Conformance inspection (see 4.6).

4.2 **Test equipment and inspection facilities.** Test and measuring equipment and inspection facilities of sufficient accuracy, quality and quantity to permit performance of the required inspection shall be used. The establishment and maintenance of a calibration system to control the accuracy of the measuring and test equipment shall be in accordance with ISO 17025 and NCSL Z540.3 as applicable.

4.2.1 **Component and material inspection.** Components and materials shall be inspected in accordance with all the requirements specified herein and in applicable documents.

4.3 **Inspection conditions.** Unless otherwise specified, all required inspections shall be performed in accordance with the test conditions specified in 4.8.

4.4 **Responsibility for compliance.** All items shall meet all requirements of sections 3, 4, and 5. The inspection set forth in this specification shall become a part of the contractor’s overall inspection system or quality program. The absence of any inspection requirements in the specification shall not relieve the contractor of the responsibility of ensuring that all products or supplies submitted to the Government for acceptance comply with all requirements of the contract. Sampling inspection, as part of manufacturing operations, is an acceptable practice to ascertain conformance to requirements, however, this does not authorize submission of known defective material, either indicated or actual, nor does it commit the Government to accept defective material.

4.5 **First article inspection.** First article inspection shall be performed on the expansion joint when a first article is required (see 3.3 and 6.2). First article inspection shall be performed at a laboratory acceptable to the Government on sample units produced with equipment and procedures used in production. This inspection shall include the examination of 4.7 and the tests of 4.8. The first article may be either a first production item or a standard production item from the supplier’s current inventory.
provided it meets the requirements of the specification and is representative of the design, construction, and manufacturing technique applicable to the remaining items to be furnished under the contract.

4.5.1 First article inspection routine. One expansion joint shall be subjected to first article testing in table I. The test sequence shall be determined by the manufacturer unless otherwise specified.

4.5.2 Samples for first article. Unless otherwise specified, after award of the contract or order, the manufacturer shall forward, from randomly selected samples, 3 expansion joints. The samples shall be representative of the construction, workmanship, components, and materials to be used during production. When a manufacturer is in continuous production of expansion joints from one contract to another or has demonstrated within the past 2 years the capability to meet the requirements of this specification, inspection of additional first article samples for a new contract may be waived at the discretion of the acquiring activity (see 6.2). Approval of the first article samples or the waiving of first article inspection does not preclude the requirements for performing conformance inspection. First article samples shall be furnished to the Government as directed by the contracting officer (see 6.2).

4.5.3 Disposition of samples. First article samples shall be furnished to the Government as directed by the contracting officer (see 6.2).

4.5.4 Failures. All samples must meet all of the contract requirements. Failure of a sample unit to pass any test shall be cause for rejection of the entire lot and to grant first article approval.

4.6 Conformance inspection. For manufacturers that have successfully passed first article inspections and are continuously producing expansion joints to this specification on going inspections shall consist of both the examination of 4.7 and the sampling inspection of 4.6.2. If first article is waived due to prior successful first article inspection the individual inspections shall be the manufacturer’s in house inspection procedures. The conformance inspection shall include the examination of 4.7 and the tests of 4.8. This inspection shall be performed on the samples selected in accordance with 4.6.2.

4.6.1 Failure. Failure of an article sample to pass any of the inspections specified herein shall be cause for the Government to refuse to accept further products until corrective action has been made and successful completion of first article testing accomplished.

4.6.2 Sampling. The unit of product shall be one expansion joint. All expansion joints offered for delivery at one time shall be considered a lot for the purpose of inspection. Every expansion joint shall be examined as specified in 4.7 and undergo the hydrostatic test (see 4.8.1).

4.6.3 Lot records. Manufacturers shall keep lot records for 3 years minimum. Manufacturers shall monitor for compliance to the prescribed procedures, and observe that satisfactory manufacturing conditions and records on lots are maintained for these expansion joints. The records, including as a minimum, an attributes summary of all quality conformance inspections conducted on each lot, shall be available to review by customers at all times.
4.7 Examination. Each expansion joint shall be examined for compliance with the requirements specified in section 3 of this document. Any redesign or modification of the contractor’s standard product to comply with specified requirements, or any necessary redesign or modification following failure to meet specified requirements shall receive particular attention for adequacy and suitability. This element of inspection shall encompass all visual examinations and dimensional measurements. Noncompliance with any specified requirements or presence of one or more defects preventing or lessening maximum efficiency shall constitute cause for rejection.

4.8 Tests. The following tests shall be performed. Failure of any expansion joint to pass any specified test shall be cause for rejection.

4.8.1 Hydrostatic test. Each joint shall be subjected to a hydrostatic pressure equal to the maximum test pressure specified (see 6.2) and shall meet the requirements of 3.5.4.

4.8.1.1 First article hydrostatic test. The following details shall apply to first article hydrostatic tests:

a. This test shall be performed first with the joint compressed to its qualifying rated compression and then with the joint extended to its rated extension.

b. When no extension is specified, this second test shall be made with the joint in its neutral position.

c. The hydrostatic pressure shall be 1-1/2 times the rated pressure unless otherwise specified (see 6.4).

4.8.1.2 Standard production hydrostatic test. This test shall be performed with the assembly in the neutral length. If the shipping length is different from the neutral length, and extends the convoluted length of the bellows, the test shall be performed with the joint at its shipping length.

4.8.2 Cyclic endurance test (see 3.5.1.2). When specified (see 6.2), a cyclic endurance test shall be performed on joints selected with the number of complete cycles as specified (see 6.2) and shall meet the requirements of 3.5.1.2. The test shall be performed under pressure at ambient temperature and the joint shall be cycled in axial movement only. During the test, the pressure in the joint shall be adjusted to simulate, as closely as possible, the maximum design conditions of the joint to be qualified. Thus, the maximum design pressure specified for the group shall be adjusted in accordance with ASME Boiler and Pressure Vessel Code, based on the ratio of the stress values for the bellows material. The pressure may vary from zero to this value during each cycle, providing the pressure reaches its maximum when the joint is compressed to its qualifying rated compression. Upon completion of the required number of cycles, each test joint shall be pressure-tested as before. If the joint fails to pass this cyclic endurance test, it shall be rejected and a new joint of improved design shall be fabricated and tested. Any change in the test joint must be reflected in the final production units.

4.8.3 Tests for pressure service. When the design pressure is equal to or larger than 15 psig the joint shall be subjected to a hydrostatic test pressure equal to 1-1/2 times the design pressure. When the design is less than 15 psig an air and soap leak test shall be performed in lieu of the hydrostatic pressure test.

4.8.4 Other tests. Examinations may also consist of one or more of the following examinations conforming to EJMA Standards:

a. Radiographic
b. Liquid penetrant
c. Fluorescent penetrant
d. Magnetic particle
e. Ultrasonic
f. Halogen leak

h. Air jet

i. A parallel/lateral force deflection test may be specified to verify force deflection requirements in certain critical applications such as steam or gas turbine applications and shall meet the requirements of 3.5.2. (Note: This parallel/lateral test is expensive and should only be required when necessary).

4.9 First article test documentation. The manufacturer shall record and document each first article test performed. This documentation shall be available to the government contracting officer (see 6.2.1). Documentation shall include, but is not limited to the following:

- The drawing number of the expansion joint.
- Mill test reports of materials used in the joint.
- Hydrostatic test pressure.
- The qualifying rated compression, extension, lateral offset, or angular rotation.
- Report of the number of complete cycles obtained.
- Report of pressure test, or other leakage test performed after completion of the cyclic endurance test.
- The adjusted internal pressure during the cyclic endurance test.

5. PACKAGING

5.1 Packaging. For acquisition purposes, the packaging requirements shall be as specified in the contract or order (see 6.2). When packaging of materiel is to be performed by DoD or in-house contractor personnel, these personnel need to contact the responsible packaging activity to ascertain packaging requirements. Packaging requirements are maintained by the Inventory Control Point’s packaging activities within the Military Service or Defense Agency, or within the military service’s system commands. Packaging data retrieval is available from the managing Military Department’s of Defense Agency’s automated packaging files, CD-ROM products, or by contacting the responsible packaging activity.

6. NOTES

(This section contains information of a general or explanatory nature that may be helpful, but is not mandatory.)

6.1 Intended use. The bellows expansion joints covered by this specification are intended for steam, water, oil, or gas piping services which require the absorption of movement resulting from the thermal expansion of piping or other factors.

6.1.1 Types of joints. The types of bellows expansion joints listed under 1.2 are basic constructions. Arrangements of this basic type vary with the individual requirements of each application. The most common arrangement is one, which absorbs axial movements. Joints of this type are sometimes suitable for the absorption of small amounts of lateral deflection. Movement other than axial motion, can be absorbed by expansion joints of special arrangement as indicated by the following examples:

- Hinged expansion joint – An expansion joint designed to permit angular rotation in one plane only by the use of a pair of pins through hinge plates attached to the expansion joint ends.
- Gimbal expansion joint – An expansion joint designed to permit angular rotation in any plane by use of two pairs of hinges affixed to a common floating gimbal ring.
- Universal expansion joint – An expansion joint containing two bellows joined by a
common connector for the purpose of absorbing any combination of the three basic movements, i.e., axial movement, lateral deflection, and angular rotation.

d. Swing expansion joint – An expansion joint designed to absorb lateral deflection and angular rotation in one plane only by the use of a pair of swing bars.

e. Pressure-balanced expansion joint – An expansion joint designed to absorb axial movement and lateral deflection while absorbing the pressure thrust by means of tie devices interconnecting the flow bellows with an opposed bellows also subjected to line pressure.

6.1.2 Pressure. Copper alloy expansion joints should be restricted to the pressure conditions specified in 3.7.1. Corrugated, unreinforced expansion joints (except copper (see 3.7.1)) are commonly limited to low-pressure services, with the upper limit being between 30 and 100 psig working pressure depending on size and the specific design. Reinforced and fabricated expansion joints (except copper (see 3.7.1)) are suitable for medium and higher pressures. All types are suitable for vacuum service.

6.1.3 Sizes. Expansion joints are custom engineered and fabricated for specified applications. Because there are infinite number of sizes that might be required for use in piping systems which include both standard and nonstandard sizes, specific sizes are not cited in the classification section 1.2.

6.2 Acquisition requirements. Acquisition documents should specify the following:

a. Title, number, and date of this specification.

b. End connections (see 3.6.1).

c. If “Van Stone” facings are required and size of material and pressure class (see 3.6.1).

d. Whether limit stops are to be provided (see 3.6.2).

e. Guides, if required (see 3.6.4).

f. Flow liners and material, if required (see 3.6.5).

g. Shrouds, if required (see 3.6.6).

h. When a cyclic endurance test is required for first article and production units and the number of complete cycles required (see 4.8.2).

i. Other tests if required (see 4.8.4).

j. Packaging (see 5.1).

6.2.1 Data requirements. When this specification is used in an acquisition and data are required to be delivered, the data requirements are developed as specified by an approved Data Item Description (DD Form 1664) and delivered in accordance with the approved Contract Data Requirements List (CDRL), incorporated into the contract. When provisions of DoD Federal Acquisition Regulations (FAR) Supplement, Part 27, Sub-Part 27.475-1 (DD Form 1423) are invoked and the DD Form 1423 is not used, the data should be delivered by the contractor in accordance with the contract or order requirements (see 4.8).

6.3 Performance. The following pertain to 3.5 and the following:

a. Bellows expansion joint design is dependent upon several variable conditions under which the joint is intended to operate. It is therefore imperative that all applicable conditions under which the joint is to operate be specified in the acquisition documents.

b. The type and degree of motion which the joint is required to absorb (see 3.5.1) is specified separately from the requirement for extra traverse motion (see 3.5.1.1). It is suggested that expansion joints are specified to be suitable for 25 percent more movement than the calculated expansion of the piping. The type and amount of motion can be specified directly, but a dimensioned and labeled sketch or drawing of the piping layout is generally preferred by
c. The life of a bellows expansion joint depends upon several variables of which the following are a few examples: thickness of bellows material, size of the bellows, number of corrugations, amount of motion, frequency of motion, temperature and pressure conditions. Therefore, no life expectancy can be generally specified for all types of joints. The life requirement is best specified by the number of complete cycles of movement which is anticipated for the period the joint should last. This would be determined by the number of times the service would be shut down over the required period, or by the number of times the temperature would vary between certain limits during the period. Vibrational movement should be specified by amplitude and frequency, as flexural stresses in the bellows under vibration should be within the proportional limit of the material used. Cyclic endurance proof tests are expensive since the joint under test is not suitable for use after the test. Such tests merely indicate suitability of design and should only be specified where critical conditions warrant the extra time and expense incurred.

6.4 Test pressure. EJMA Standards usually test their joints at 1-1/2 times rated pressure (see 6.2). Joints can be manufactured for test at pressures higher than 1-1/2 times the rated pressure, but to do so will usually force the design to be based on the test pressure rather than on the operating pressure. Such practice would in most cases require an increase in thickness of the bellows material and a corresponding increase in the number of corrugations to realize the cyclic endurance life. The characteristics of a particular application should govern the decision to alter the test pressure requirements specified in 6.2.

6.5 First article. When a first article inspection is required, the item will be tested and should be a first production item or it may be a standard production item from the contractor's current inventory as specified in 4.5. The first article should consist of one expansion joint. The contracting officer should include specific instructions in acquisition documents regarding arrangements for examination, test, and approval of first article.

6.6 Environmentally preferable material. Environmentally preferable materials should be used to the maximum extent possible to meet the requirements of this specification. As of the dating of this document, the U.S. Environmental Protection Agency (EPA) is focusing efforts on reducing the 31 priority chemicals. The list of chemicals and additional information is available on their website http://www.epa.gov/osw/hazard/wastemin/priority.htm. Use of these materials should be minimized or eliminated unless needed to meet the requirements specified herein (see section 3).

6.7 Subject term (key word) listing.

Axial movement
Corrugations
Diaphragm
Drain
Nickel
Rings
Sleeves
Valves

6.8 Changes for previous issue. Marginal notations are not used in this revision to identify changes with respect to the previous issue due to the extensive change.
