1/ For a power supply of 5 V ±10% the worst case output voltages (V_{OH} and V_{OL}) occur for HC at 4.5 V. Thus, the 4.5 V values should be used when designing with this supply. Worst case V_{IH} and V_{IL} occur at V_{CC} = 5.5 V and 4.5 V respectively. (The V_{IH} value at 5.5 V is 3.85 V.) The worst case leakage current (I_{IN}, I_{CC}, and I_{OZ}) occur for CMOS at the higher voltage, and so the 6.0 V values should be used. Power dissipation capacitance (C_{PD}), typically 40 pF, determines the no load dynamic power consumption, P_D = C_{PD} V_{CC}² f + I_{CC} V_{CC}, and the no load dynamic current consumption, I_S = C_{PD} V_{CC} f + I_{CC}.

2/ Test not required if applied as a forcing function for V_{OH} and V_{OL}.

3/ For V_{CC} = 2.0 V and 6.0 V, this parameter shall be guaranteed, if not tested, to the limits specified in table I.

4/ Transition time (t_{THL}, t_{TLH}), if not tested, shall be guaranteed to the specified parameters.
