1/ For a power supply of 5 V ±10% the worst case output voltages (V<sub>OH</sub> and V<sub>OL</sub>) occur for HC at 4.5 V. Thus, the 4.5 V values should be used when designing with this supply. Worst case V<sub>IH</sub> and V<sub>IL</sub> occur at V<sub>CC</sub> = 5.5 V and 4.5 V respectively. (The V<sub>IH</sub> value at 5.5 V is 3.85 V.) The worst case leakage current (I<sub>IN</sub>, and I<sub>CC</sub>) occur for CMOS at the higher voltage, and so the 6.0 V values should be used. Power dissipation capacitance (C<sub>PD</sub>), typically 80 pF, determines the no load dynamic power consumption, P<sub>D</sub> = C<sub>PD</sub> V<sub>CC</sub><sup>2</sup> f + I<sub>CC</sub> V<sub>CC</sub>, and the no load dynamic current consumption, I<sub>S</sub> = C<sub>PD</sub> V<sub>CC</sub> f + I<sub>CC</sub>.

2/ V<sub>IH</sub> and V<sub>IL</sub> tests are not required if applied as a forcing function for V<sub>OH</sub> and V<sub>OL</sub>.

3/ AC testing at V<sub>CC</sub> = 2.0 V and V<sub>CC</sub> = 6.0 V shall be guaranteed, if not tested, to the limits specified in table I.

4/ Transition time (t<sub>THL</sub>, t<sub>TLH</sub>), if not tested, shall be guaranteed to the specified parameters.
