- 1/ For a power supply of 5.0 V ±10% the worst case output voltage (V_{OH} and V_{OL}) occur for HC at 4.5 V. Thus, the 4.5 V values should be used when designed with this supply. Worst case V_{IN} and V_{IL} occur at V_{CC} = 5.5 V and 4.5 V, respectively. (The V_{IH} value at V_{CC} = 5.5 V is 3.85 V.) The worst case leakage current (I_{IN}, I_{CC}, and I_{OZ}) occur for CMOS at the higher voltage so the 6.0 V values should be used. Power dissipation capacitance (C_{PD}), typically 150 pF, determines the no load dynamic power consumption, P_D = C_{PD} V_{CC}² f + I_{CC} V_{CC}; and the no load dynamic current consumption, I_S = C_{PD} V_{CC} f + I_{CC}.
- 2/ Test not required if applied as a forcing function for V_{OH} or V_{OL}.
- 3/ Parameter I_{IN2} shall be guaranteed if not tested.
- 4/ AC testing at V_{CC} = 2.0 V and V_{CC} = 6.0 V shall be guaranteed, if not tested, to the limits specified in table I.
- 5/ Transition times (t_{TLH}, t_{THL}) shall be guaranteed, if not tested, to the limits specified in table I.
- 6/ Output pulse width at V_{CC} = 3.0 V shall be guaranteed, if not tested, to the limits specified in table I.
