TABLE I. Electrical performance characteristics – Continued.

1/ For a power supply of 5.0 V \pm 10%, the worst case output voltages (V_{OH} and V_{OL}) occur at $V_{CC} = 4.5$ V. Thus, the 4.5 V values should be used when designing with this supply. Worst case V_{IH} and V_{IL} occur at $V_{CC} = 5.5$ V and 4.5 V, respectively. (The V_{IH} value at 5.5 V is 3.85 V). The worst case leakage currents (I_{IN} and I_{CC}) occur for CMOS at the higher voltage, so the 6.0 V value should be used. Power dissipation capacitance (C_{PD}), typically 100 pF, determine the no-load dynamic power consumption (P_D) and the no-load dynamic current consumption (I_S).

Where

$$P_D = C_{PD} V_{CC}^2 f + I_{CC} V_{CC}$$

$$I_S = C_{PD} V_{CC} f + I_{CC}$$

f is the frequency of the input signal.

2/ Test not required if applied as a forcing function for V_{OH} or V_{OL} .

3/ AC testing at $V_{CC} = 2.0$ V and $V_{CC} = 6.0$ V shall be guaranteed, if not tested, to the specified parameters.

4/ Transition time (t_{TLH} , t_{THL}), if not tested, shall be guaranteed to the specified parameters.
