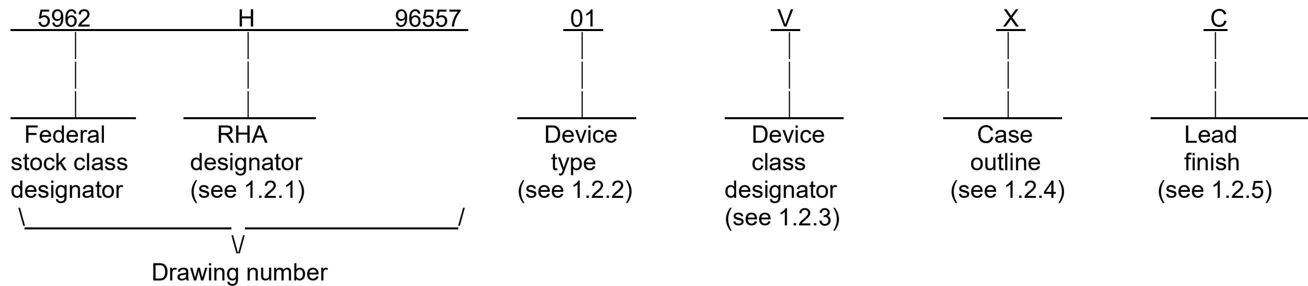
DISTRIBUTION STATEMENT A. Approved for public release; distribution is unlimited.

1. SCOPE

1.1 Scope. This drawing documents two product assurance class levels consisting of high reliability (device class Q) and space application (device class V). A choice of case outlines and lead finishes are available and are reflected in the Part or Identifying Number (PIN). When available, a choice of Radiation Hardness Assurance (RHA) levels is reflected in the PIN.

1.2 PIN. The PIN is as shown in the following example:



1.2.1 RHA designator. Device classes Q and V RHA marked devices meet the MIL-PRF-38535 specified RHA levels and are marked with the appropriate RHA designator.

1.2.2 Device type(s). The device type(s) identify the circuit function as follows:

Device type	Generic number	Circuit function
01	54ACTS164	Radiation hardened, 8-bit serial-in/parallel-out shift register, TTL compatible inputs
02	54ACTS164E	Enhanced radiation hardened, 8-bit serial-in/ parallel-out shift register, TTL compatible inputs
03	54ACTS164E	Enhanced radiation hardened, 8-bit serial-in/ parallel-out shift register, TTL compatible inputs

1.2.3 Device class designator. The device class designator is a single letter identifying the product assurance level as follows:

Device class	Device requirements documentation

1/ Each input/output, as applicable, shall be tested at the specified temperature, for the specified limits, to the tests in table IA herein. Output terminals not designated shall be high level logic, low level logic, or open, except for the I_{DDQ} and ΔI_{DD} tests, the output terminals shall be open. When performing the I_{DDQ} and ΔI_{DD} tests, the current meter shall be placed in the circuit such that all current flows through the meter.

2/ RHA device type 01 and 02 devices supplied to this drawing have been characterized through all levels M, D, P, L, R, F, G, and H of irradiation. RHA device type 03 devices supplied to this drawing have been characterized through all levels M, D, P, L, R, F and G of irradiation. Device type 01 is tested in accordance with MIL-STD-883, method 1019, condition A for RHA level "H". Device type 02 is irradiated at dose rate = 50 - 300 rad (Si)/s in accordance with MIL-STD-883, method 1019, condition A, and is guaranteed to a maximum total dose specified. The effective dose rate after extended room temperature anneal = 1 Rad (Si)/s per MIL-STD-883, method 1019, condition A, section 3.11.2. The total dose specification for this device only applies to the specified effective dose rate, or lower, environment. Device 02 is tested for RHA level "H". Device type 03 is tested in accordance with MIL-STD-883, method 1019, condition A for RHA level "G".

Each device type supplied to this drawing is guaranteed to comply with specification table IA through all RHA levels up to, and including, the maximum RHA level listed in section .1.5 Radiation features. Pre and post irradiation values are identical unless otherwise specified in table IA. When performing post irradiation electrical measurements for any RHA level, T_A=+25°C.

TABLE IA. Electrical performance characteristics – Continued.

3/ For negative and positive voltage and current values, the sign designates the potential difference in reference to V_{SS} and the direction of current flow, respectively; and the absolute value of the magnitude, not the sign, is relative to the minimum and maximum limits, as applicable, listed herein.

4/ This test is guaranteed based on characterization data but not tested.

5/ This test may be performed either one input at a time (preferred method) or with all input pins simultaneously at $V_{IN} = V_{DD} – 2.1$ V (alternate method). Classes Q and V shall use the preferred method. When the test is performed using the alternate test method, the maximum limit is equal to the number of inputs at a high TTL input level times 1.6 mA; and the preferred method and limits are guaranteed. For the preferred method, a minimum of one input shall be tested. All other inputs shall be guaranteed, if not tested, to the limits specified in table IA, herein.

6/ This parameter is supplied as design limit but not guaranteed or tested.

7/ No more than one output should be shorted at a time for a maximum duration of one second.

8/ This value is calculated during the design/qualification process and is supplied as a design limit but is not tested. The power dissipation per switching output (P_{SW}) is calculated for a logic device by using power dissipation equation P_{TOTAL}.

To determine total power use the formula:

$P_{TOTAL} = (N_{SW} \times P_{SW/OUTPUT} \times f)$, Wherein, N_{SW} = number of switching outputs, $P_{SW/OUTPUT}$ = Power dissipation per switching output in mW/MHz from Table IA and f is the operating frequency that the outputs are switching.

9/ The test vectors used to verify the truth table shall, at a minimum, test all functions of each input and output. All possible input to output logic patterns per function shall be guaranteed, if not tested, to the truth table in figure 2 herein. For V_{OUT} measurements, L ≤ 0.5 V and H ≥ 4.0 V and are tested at V_{DD} = 4.5 V and V_{DD} = 5.5 V; L ≤ 0.5 V and H ≥ 2.5 V and are tested at V_{DD} = 3.0 V and V_{DD} = 3.6 V.

10/ For propagation delay tests, all paths must be tested.

11/ Based on characterization, hold time (t_h) of 0 ns can be assumed if the data setup time (t_{S1}) is ≥ 10 ns. This is guaranteed but not tested.
