Testing and other quality control techniques are used to the extent deemed necessary to assure product performance over the specified temperature range. Product may not necessarily be tested across the full temperature range and all parameters may not necessarily be tested. In the absence of specific parametric testing, product performance is assured by characterization and/or design.

 $[\]frac{1}{2}$ This is the increase in supply current for each input that is at one of the specified TTL voltage levels, rather than 0.0 V or V_{CC}.
