1/ Testing and other quality control techniques are used to the extent deemed necessary to assure product performance over the specified temperature range. Product may not necessarily be tested across the full temperature range and all parameters may not necessarily be tested. In the absence of specific parametric testing, product performance is assured by characterization and/or design.

2/ C_{PD} is used to determine the dynamic power consumption, per gate.

$$P_D = V_{CC}^2 f_i (C_{PD} + C_L)$$

f_i = input frequency

C_L = output load capacitance

V_{CC} = supply voltage
