- 1/ Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- 2/ Tested at -55°C to +125°C.
- 3/ RFx off port inputs to ground = -0.5 V to V_{DD} - 0.5 V.
- 4/ See Table I.
- 5/ Input power is tested with switch in both open and close position. Power is applied on RFx, while RFC is terminated to a 50 Ω resistor to GND.

- 1/ Testing and other quality control techniques are used to the extent deemed necessary to assure product performance over the specified temperature range. Product may not necessarily be tested across the full temperature range and all parameters may not necessarily be tested. In the absence of specific parametric testing, product performance is assured by characterization and/or design.
- 2/ $V_{DD} = 1.65 V$ to $2.75 V$, $GND = 0 V$, input power = 0 dBm, temperature range = $-55^\circ C$ to $+125^\circ C$, unless otherwise noted.
- 3/ Typical values are at $V_{DD} = 2.5 V$ and $25^\circ C$, unless otherwise stated.
- 4/ Guaranteed by design, not subject to production test.
- 5/ Video feedthrough is the dc transience at the output of any port of the switch when the control voltage is switched from high to low or low to high in a 50Ω test setup, measured with 1 ns rise time pulses and 500 MHz bandwidth.
- 6/ Less than 100 MHz, refer to the AN-952 Application Note for more information about power handling.
